

# ECOO '17 R3 P3 - Region Selection

---

The semi-final of the `OCEE` provincial competition happens at two different locations in Ontario. Ontario is a big place, so the locations need to be carefully chosen to accommodate the participants as best as possible.

In particular, a school's travel cost to the competition is equal to the square of the distance between the school and the nearest semi-final location. An optimal location selection would minimize the sum of these squared distances for every school.

Given the locations of all participating schools, can you determine the optimal placements of the two semi-finals?

## Input Specifications

---

The input will contain 10 test cases. Each case begins with an integer  $N$  which represents the number of schools competing ( $1 \leq N \leq 100$ ).  $N$  lines follow, each containing two integers  $X$  and  $Y$ , representing the locations of a school ( $1 \leq X, Y \leq 1\,000$ ). No two schools will be at the same location.

For 40% of the cases,  $N, X, Y \leq 40$ .

**Note:** Half of the marks per test case will be awarded if the difference between the program output and official answer is positive and *at most* 10.

**Note:** If one or more answers are not rounded to the nearest integer, 20 points will be deducted once.

## Output Specifications

---

For each test case, output the minimum total sum of every school's travel costs, rounded to the nearest integer.

## Sample Input

---

```
3
1 1
2 2
3 3
6
1 1
2 1
3 1
1 4
2 4
3 4
```

# Sample Output

1  
4

**Note:** Only 2 cases are shown in this sample.
