

CCC '08 S3 - Maze

In order to make a few dollars, you have decided to become part of a scientific experiment. You are fed lots of pizza, then more pizza and then you are asked to find your way across the city on a scooter powered only by pizza. Of course, the city has lots of intersections, and these intersections are very controlled. Some intersections are forbidden for you to enter; some only let you move north/south as you leave the intersection; others let you move only east/west as you leave the intersection; and the rest let you go in any compass direction (north, south, east or west).

Thankfully your scientific friends have given you a map of the city (on the back of a pizza box), with an arrangement of symbols indicating how you can move around the city. Specifically, there are 4 different symbols on the box:

- The symbol ☐+ indicates we can move in any direction (north/south/east/west) from this location.
- The symbol ☐- indicates we can move only east or west from this location.
- The symbol ☐| indicates we can move only north or south from this location.
- The symbol ☐* indicates we cannot occupy this location.

Your task is to determine how many intersections you must pass through to move from the north-west corner of the city to the south-east corner of the city.

Input Specification

The input begins with a number t ($1 \leq t \leq 10$) on its own line, which indicates how many different cases are contained in this file. Each case begins with a number r on one line, followed by a number c on the next line ($1 \leq r, c \leq 20$). The next r lines contain c characters, where each character is one of {☐+, ☐*, ☐-, ☐|}. You may assume the north-west corner of the city can be occupied (i.e., it will not be marked with ☐*).

Output Specification

The output will be t lines long, with one integer per line. The integer on line i ($1 \leq i \leq t$) indicates the minimum number of intersections required to pass through as you move from the north-west corner of the city to the south-east corner of the city. If there is no way to get from the north-west corner to the south-east corner, output ☐-1 for that test case.
