

Canadian Computing Competition: 2002 Stage 1, Junior #1

Most digital devices show numbers using a seven segment display. The seven segments are arranged as shown:

For this problem each segment is represented by three asterisks in a line as shown above.  
Any digit from 0 - 9 can be shown by illuminating the appropriate segments. For example the digit 1 may be displayed using the two segments on the right side:

The digit 4 needs four segments to display it properly:

```
*      *
*      *
*      *
* * *
      *
      *
      *
```

Write a program that will accept a single digit input from the user, and then display that digit using a seven segment display. You may assume that each segment is composed of three asterisks.

## Sample Input

---

9

## Sample Output

---

```
* * *
*      *
*      *
*      *
* * *
      *
      *
      *
* * *
```
