

TLE '17 Contest 2 P2 - Unlucky Numbers

The University of Fireloo is about to build a new on-campus residence named **University of Fireloo Place (UFP)**, a village with N apartment buildings!

Apparently, UFP's architects are quite superstitious, so they believe that the K distinct numbers u_1, \dots, u_K are "unlucky". As a result, for the i^{th} apartment building, they want the floors to be numbered from 1 to f_i inclusive, but removing all floors with unlucky floor numbers.

Now, the architects need your help to determine how many floors each apartment in UFP should really have.

The bright red buildings and skies of the University of Fireloo.

Constraints

$$1 \leq N \leq 1\,000\,000$$

$$1 \leq K \leq 500\,000$$

$$1 \leq f_i \leq 1\,000\,000 \quad (i = 1, \dots, N)$$

$$1 \leq u_j \leq 1\,000\,000 \quad (j = 1, \dots, K)$$

For 20% of the points, $N, f_i, u_j \leq 100$, and $K \leq 10$ for all i and j .

For an additional 30% of the points, $N, f_i, u_j \leq 100\,000$, and $K \leq 10\,000$ for all i and j .

Input Specification

The first line contains K , the number of unlucky numbers the architects have considered.

The second line contains distinct, space-separated positive integers u_1, \dots, u_K , the unlucky numbers.

The third line contains N , the number of apartments to be built in UFP.

For the next N lines, the i^{th} line contains f_i , the top floor number of the i^{th} apartment. It is guaranteed that no top floor number is an unlucky number.

Output Specification

Output N lines, where the i^{th} line contains one integer denoting the actual number of floors the i^{th} apartment should have.
